

Example Quarto Document

Waranya Ratirotnanakul (36851256)

This guide demonstrates the basic steps required to create a reproducible project using RStudio and Quarto. Reproducible reporting ensures that analyses can be rerun and produce consistent results by combining code, output, and documentation in a single workflow. The purpose of this guide is to establish the foundation for version control and collaborative practices using Git and GitHub.

Step 1 — Create a New RStudio Project and example.qmd

1. Create a New RStudio Project

The first step in creating a reproducible workflow is to create a new RStudio Project. A project provides a structured environment where all files related to the analysis are stored together.

To create a new project in RStudio: 1) Open RStudio. 2) Click File → New Project. 3) Select New Directory. 4) Select New Project. 5) Enter a project name (for example, gitguide_project). 6) Choose a location to save the project. 7) Click Create Project.

After completing these steps, a new folder containing an `.Rproj` file will be created.

2. Create a Quarto File

Inside the project folder, create a simple Quarto document named `example.qmd`.

To create the file: 1) Click File → New File → Quarto Document. 2) Save the file as `example.qmd` in the project folder.

Below is a simple example of a Quarto document that can be rendered into an HTML file.

- At YMAL:

```
# Simple calculation
x <- 10
y <- 5
x + y
```

```
[1] 15
```

3. Render the Quarto File

To generate the HTML output, click the Render button in RStudio. After rendering, an HTML file named `example.html` will be created in the project folder.

When the file is rendered successfully, the output will display the result of the calculation:

$10 + 5 = 15$

This confirms that the Quarto document has been successfully knitted into an HTML file and demonstrates the integration of code and output within a reproducible report.

What Your Folder Should Look Like

gitguide_project/ example.qmd example.html gitguide_project.Rproj
